Cylinder

- 1 A cylinder is a closed solid that has two parallel bases connected by a curved surface.
- 2 A surface consisting of all the points on all the lines which are parallel to a given line and which pass through a fixed line/Plane curve in a plane not ~~not~~ parallel to the given line

1. Right cylinder

When the Two bases are exactly over each other and axis is a right angle to The base.

② Oblique cylinder

If one base is displaced sideways, the axis is not at right angle to The bases. bases are parallel but not directly over each other

Find an equation of the cylinder with directrix $C: y - z^2 = 0$ and having elements parallel to $\vec{n} = [1 \ 2 \ 3]$.

$$[x \ y \ z] = [0 \ y_1 \ z_1] + t[1 \ 2 \ 3]$$

$$[x \ y \ z] = [0 \ y_1 \ z_1] + [t \ 2t \ 3t]$$

$$[x \ y \ z] = [0+t \ y_1+2t \ z_1+3t]$$

$$x = t, \quad y = y_1 + 2t, \quad z = z_1 + 3t$$

$$y = y_1 + 2x, \quad z = z_1 + 3x$$

$$y - 2x = y_1, \quad z - 3x = z_1$$

$$y = y_1, \quad z = z_1$$

$$y - z^2 = 0, \quad y_1 - z_1^2 = 0$$

$$y_1 = z_1^2$$

$$y - 2x = (z - 3x)^2$$

If Trace of cylinder at $x = d$

$$y - 2d = (z - 3d)^2$$

$$[(y - 2d) - (z - 3d)^2] = 0$$

Find an equation of the right cylinder whose directrix to the circle with centre $C(5, 3, 0)$

$$r = 4$$

Circle equation

$$(x - x_0)^2 + (y - y_0)^2 + (z - z_0)^2 = r^2$$

$$(x-5)^2 + (y-3)^2 + (z-0)^2 = 4^2$$

$$[x^2 - 2(x)(5) + 5^2] + [y^2 - 2(y)(3) + 3^2] + z^2 = 16$$

$$x^2 - 10x + 25 + y^2 - 6y + 9 + z^2 - 16 = 0$$

$$x^2 + y^2 + z^2 - 10x - 6y + 25 + 9 - 16 = 0$$

$$x^2 + y^2 + z^2 - 10x - 6y + 34 - 16 = 0$$

$x^2 + y^2 + z^2 - 10x - 6y + 18 = 0$ is equation of directrix.

Elliptic cylinder: Directrix is ellipsis

An elliptic cylinder is a set of points (x, y, z) satisfying the equation

$$\left(\frac{x}{a}\right)^2 + \left(\frac{y}{b}\right)^2 = 1 \quad xy\text{-plane, } z=0$$

$$\left(\frac{y}{a}\right)^2 + \left(\frac{z}{b}\right)^2 = 1 \quad yz\text{-plane, } x=0$$

$$y=0$$

$$\frac{x^2}{a^2} + \frac{z^2}{b^2} = 1, \left(\frac{x}{a}\right)^2 + \left(\frac{z}{b}\right)^2 = 1 \quad xz\text{-plane}$$

Example

Discuss the surface

$$8x^2 + 15y^2 - 5 = 0$$

Solution

$$8x^2 + 15y^2 = 5$$

$$\frac{8x^2}{5} + \frac{15y^2}{5} = \frac{5}{5}$$

$$\frac{8x^2}{5} + \frac{3y^2}{1} = 1$$

$$\frac{x^2}{5/8} + \frac{y^2}{1/3} = 1$$

So, it is elliptic cylinder

Hyperbolic cylinder: Directrix is Hyperbola

A hyperbolic cylinder is set of points (x, y, z) satisfying the equation

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \quad xy\text{-plane}, z=0$$

$$\left(\frac{x}{a}\right)^2 - \left(\frac{y}{b}\right)^2 = 1$$

$$\frac{y^2}{a^2} + \frac{z^2}{b^2} = 1 \quad yz\text{-plane}, x=0$$

$$\frac{x^2}{a^2} - \frac{z^2}{b^2} = 1 \quad xz\text{-plane}, y=0$$

Example 1

Discuss the surface

$$5x^2 - 12y^2 - 7 = 0$$

Solution

$$5x^2 - 12y^2 = 7$$

$$\frac{5x^2}{7} - \frac{12y^2}{7} = 1$$

$$\frac{x^2}{7/5} - \frac{y^2}{7/12} = 1$$

So, it is a Hyperbolic cylinder

Parabolic cylinder

Directrix is parabola.

a parabolic cylinder is set of points (x, y, z) satisfying the equation

$x = cz^2$,	$x = cy^2$	$xy\text{-plane, } z = 0$
$y = cx^2$,	$y = cz^2$	$yz\text{-plane, } x = 0$
$z = cy^2$	$z = cx^2$	$xz\text{-plane, } y = 0$

Spherical Trigonometry

Main branch of mathematics

- (i) Arithmetic (ii) Algebra (iii) Geometry

Geometry

The mathematical study of properties, measurement, relationship of points, circles, line planes, surfaces, angles etc.

Two-dimensional figures

It is a figure that has length and width but no depth. in x -axis and y -axis
 e.g. circles, squares, rectangle, triangles etc

Three-dimensional figures

It is a figure that has length, width and depth. x -axis, y -axis, z -axis
 e.g. cube, ~~prism~~ prism, sphere, cylinder, cone.

Types of Geometry

- (i) Plane geometry (ii) Solid geometry
 (iii) Spherical geometry

1 Plane geometry

which deals with only two dimensions.

e.g circle

$r = \text{radius}$

$d = \text{diameter}$

$$d = 2r$$

$$C = 2\pi r = \pi d$$

$$A = \pi r^2$$

$l = \text{length of arc} = r\theta$

$$\text{Area of sector} = \frac{1}{2} r^2 \theta$$

(2) Solid Geometry

which deals with all Three-dimensions.

e.g. cube, sphere, cylinder, cone, etc.

Trigonometry

It is the branch of geometry that studies relationships involving length and angles of Triangles.

e.g

Equilateral Δ

Isosceles Δ

scalene Δ

By angles

Acute Δ

one angle = 90

Right Δ

one angle > 90

obtuse Δ

Spherical geometry

The study of figures on
 The surface of The sphere.

Surface of sphere is not flat

AB is not a ^{straight} line

AB is curve because

football

Surface of sphere is not flat

Spherical Trigonometry

It deals with triangles
 drawn on The surface of sphere.

not plane triangle

all sides are arc

Lecture - 41

Intersection of a plane and a sphere

Great circle

A great circle of a sphere is
 The intersection of the sphere and a plane such
 that the plane passes Through the centre
 of the sphere.

Small Circle

A small circle of a sphere is the intersection of the sphere and a plane such that the plane does not pass through the centre of the sphere.

Shortest distance between two points on the surface of sphere/earth

Spherical angle

It is the angle between two intersecting arcs on a sphere, and is measured by the angle between the planes of the great circles containing the arcs.

Spherical Triangle

A spherical triangle is a part of surface of sphere formed by Three great circular arcs intersecting pairwise in Three vertices.

Spherical Triangle

- 1 The Three sides are all The arcs of great circles.
- (2) Any Two sides are ~~Two~~ together longer Than The Third side
- (3) The sum of Three angles is greater Than 180°
- (4) Each individual spherical angle is less Than 180°

Plane triangle

- (1) The Three sides are straight lines on The surface of plane
- (2) Any two sides are together longer Than The Third side
- (3) The sum of Three angles is always equal to 180°
- (4) Each individual angle is less Than 180°

The cosine formula

AOB, AOC and BOC are Three planes

l, m, n are unit vectors. so $r = |l| = |m| = |n| = 1$

$$l = r\theta$$

$$b = (1)\theta$$

$$b = \theta$$

so,

$$a = \theta$$

$$l = \theta$$

$$l \cdot b = r = 1$$

Using dot and cross product

$$(l \times m) \cdot (l \times n) = \begin{vmatrix} l \cdot l & l \cdot m \\ m \cdot l & m \cdot n \end{vmatrix} = 1$$

$$\begin{aligned} \text{Take R.H.S} &= \begin{vmatrix} |l||l|\cos 0 & |l||m|\cos b \\ |m||l|\cos c & |m||n|\cos a \end{vmatrix} \\ &= \begin{vmatrix} 1 & \cos b \\ \cos c & \cos a \end{vmatrix} = \cos a - \cos b \cos c \quad (2) \end{aligned}$$

$$\text{Take L.H.S} = (l \times m) \cdot (l \times n)$$

$$= |l \times m| |l \times n| \cos A \quad \text{dot Rule}$$

$$= (|l||m|\sin c)(|l||n|\sin b) \cos A \quad \text{Cross}$$

$$= \sin b \sin c \cos A \quad (3)$$

Value of (2) and (3) put in (1)

$$\sin b \sin c \cos A = \cos a - \cos b \cos c$$

$$\sin b \sin c \cos A + \cos b \cos c = \cos a$$

$$\cos a = \cos b \cos c + \sin b \sin c \cos A$$

$$\cos b = \cos a \cos c + \sin a \sin c \cos B$$

$$\cos c = \cos a \cos b + \sin a \sin b \cos C$$

The Sine formula

$$(l \times m) \times (l \times n) = [lmn] \hat{l} - [lm] n$$

$$= [lmn] \hat{l} \quad \therefore [lm] n = 0 \text{ because same vector } \hat{l}$$

$$(l \times m) \times (l \times n) = [lmn] \hat{l} \quad \text{--- (1)}$$

$$\text{Take L.H.S} = (l \times m) \times (l \times n)$$

$$= |l \times m| \times |l \times n| \sin A \hat{l}$$

$$= (|l||m| \sin c)(|l||n| \sin b) \sin A \hat{l}$$

$$= \sin c \sin b \sin A \hat{l}$$

$$\text{So, } \sin b \sin c \sin A \hat{l} = [lmn] \hat{l}$$

$$\sin b \sin c \sin A = [lmn] \quad \text{coefficient - } \hat{l}$$

$$\sin a \sin c \sin B = [lmn]$$

$$\sin a \sin b \sin C = [lmn]$$

$$\sin b \sin c \sin A = \sin a \sin c \sin B = \sin a \sin b \sin C$$

Divided by $\sin a \sin b \sin c$

$$\frac{\sin A}{\sin a} = \frac{\sin B}{\sin b} = \frac{\sin C}{\sin c}$$

$$\text{Longitude} = AOB = \lambda \quad P(\lambda, \phi)$$

$$\text{Latitude of Khana-e-Kaba} = \phi_0 = 21^\circ 25' 2'' N$$

Qibla direction

$$\tan i = P - Q, \quad i = \tan^{-1}(P - Q)$$

$$P = \frac{\sin \phi}{\tan \lambda}, \quad Q = \frac{\cos \phi \tan \phi_0}{\sin \lambda}$$

the classical longitude (λ) of a place can be found by

$\lambda^\circ E$ If $\lambda_0 < \lambda \leq 180^\circ$ Then $l = (\lambda - \lambda_0)^\circ CE$

If $0^\circ \leq \lambda < \lambda_0$ Then $l = (\lambda_0 - \lambda)^\circ CW$

$\lambda^\circ W$

If $0^\circ < \lambda < 180^\circ - \lambda_0$ Then $l = (\lambda_0 + \lambda)^\circ CE$

If $180^\circ - \lambda_0 < \lambda < 180^\circ$ Then $l = [360 - (\lambda_0 + \lambda)]^\circ CE$

Example

Find the direction of Qibla of Badshahi Mosque, Lahore

$$\lambda_0 = 74^\circ 18.7'E$$

$$\phi_0 = 31^\circ 35.4'N$$

Solution

$$l = \lambda - \lambda_0$$

$$\lambda_0 = 39^\circ 49.2'E$$

$$= 74^\circ 18.7'E - 39^\circ 49.2'E \quad \phi_0 = 21^\circ 25.2'N$$

$$= 34^\circ 29.5'CE$$

$$P = \frac{\sin \phi}{\tan l} = \frac{\sin (31^\circ 35.4')}{\tan (34^\circ 29.5')} = 0.7624$$

$$Q = \frac{\cos \phi \tan \phi_0}{\sin l} = \frac{\cos 31^\circ 35.4' \tan 21^\circ 25.2'}{\sin 34^\circ 29.5'} = \frac{0.5901}{0.5643}$$

$$Q = 0.5901$$
